WARNINGS

How to Calculate the water temperature in the first dough:

This method is correct if you have a kneader with diving arms, if alternatively you have a spiral kneader, and keeping in mind that the same tends to heat the dough a lot, reduce the water temperature by at least 5 °C.

In order to obtain the correct final temperature of the dough, let's assume 26 to C, follow the diagram below.

It will be necessary to know and then measure 3 values:

1) the value of the ambient temperature

2) the temperature value of the Dolce Forno

3) the value defined in function of the mixer used (plunger 15, spiral or planetary mixer 20).

CALCULATION: Final Temperature 26 months C x 3 (fixed number) = 78 - value 1 (e.g. 20 years C) - value 2 (e.g. 18 years C) - value 3 (e.g. 15) = 78-20-18-15 = 25 which will be the temperature of the water in the first mixture using a dipper
